WE CLAIM:

- 1. A method of JPEG compression of an image frame divided up into a plurality of non-overlapping, tiled 8 \times 8 pixel blocks B_{ij} where i, j are integers covering all of the blocks in the image frame, comprising:
- (a) forming a discrete cosine transform (DCT) of each block B_{ij} of the image frame to produce a matrix of blocks of transform coefficients D_{ij} ;
- (b) calculating a visual importance, I_{ij} , for each block of the image, based upon assigning zeros for flat features and values approaching unity for sharply varying features;
 - (c) forming a global quantization matrix Q by one of
 - (i) selecting a standard JPEG quantization table and
 - (ii) selecting a quantization table such that the magnitude of each quantization matrix coefficient Q_{ij} is inversely proportional to the importance in the image of the corresponding DCT basis vector; and

25

20

(d) selecting a linear scaling factor S_{ij} defining bounds over which the image is to be variably quantized;

- (e) quantizing the transform coefficients, D_{ijmn} , by an equivalent of dividing them by a factor S_{min}^*Q , where S_{min} is a user selected minimum scaling factor, and
- (f) entropy encoding quantized coefficients $T_{\scriptscriptstyle ijmn}$ and Q *S_{\tiny min} to create a JPEG image file.
- 2. A method according to claim 1, wherein step (e) includes rounding $(D_{ijmn}/(S_{min}*Q))$ to the nearest integer to form quantized DCT transformed coefficients T_{ijmn} ;
 - (a) setting $T_{ijmm} = 0$ if $round(D_{ijmm}/(Q_{mn}*S_{ij})) = 0$; and
- $(b) \quad \text{setting } T_{ijmn} = \text{sign}(D_{ijmn}) * (2^{(ceil(lg(abs(D_{ijmn})+1))-1}) 1) 1) \\ \text{if } abs(D_{ijmn}) (2^{(ceil(lg(abs(D_{ijmn})+1))-1)-1}) \\ \text{ is less than } \\ \text{or equal to } abs(D_{ijmn} Q_{mn}S_{ij} * \text{round}(D_{ijmn}/(S_{ij}*Q_{mn}))); \\ \\ \text{}$
- 3. A method according to claim 1, including calculating a linear scaling factor S_{ij} equal to $I_{ij}*(S_{max} S_{min}) + S_{min}$ where S_{min} and S_{max} are user specified to define bounds over which the image will be variably quantized.
- The method according to claim 1, where I_i, is determined
 by discrete edge detection and summation of transform coefficients.

- 5. The method according to claim 1, wherein I_{ij} is determined by creating a 24 x 24 matrix of image pixels of DCT coefficients centered on a block B_{ij} , where i and j =1, 2,...8, convolving said 24 x 24 matrix with an edge tracing kernel to produce a convolved matrix, summing center 10 x 10 matrix values of said convolved matrix to produce a summed value, and normalizing said summed value to produce a visual importance, I_{ij} .
- 6. The method according to claim 1, wherein said Q is formed by calculating an 8 \times 8 matrix A by calculating matrix elements A_m of said A according to the formula

$$A_{mn} = \prod_{(i,j)} \left(B_{ij} \right)_{mn},$$

calculating elements $\mathbf{Q}_{\!_{mm}}$ of said Q according to the formula

$$Q_{mn} = max(A_{mn})/A_{mn}$$

- and scaling values of Q_{mn} for all values of (m,n) except (0,0) in order to minimize an error between Q and a standard JPEG quantization matrix.
- 25 7. A method of JPEG compression of an image frame divided up into a plurality of non-overlapping, tiled 8 x 8 pixel blocks B_{ij} where i, j are integers covering all of the blocks in the image frame, comprising:

- (a) forming a discrete cosine transform (DCT) of each block B_{ij} of the image frame to produce a matrix of blocks of transform coefficients D_{ij} ;
- (b) calculating a visual importance, I_{ij} , for each block of the image, based upon assigning zeros for flat features and values approaching unity for sharply varying features;
 - (c) forming a global quantization matrix Q by one of
 - (i) selecting a standard JPEG quantization table and
 - (ii) selecting a quantization table such that the magnitude of each quantization matrix coefficient Q_{ij} is inversely proportional to a visual importance, I_{ij} , to the image of a corresponding DCT basis vector; and
- 20 (d) selecting a linear scaling factor S_{ij} defining bounds over which the image is to be variably quantized wherein $S_{ij} = l_{ij} (S_{max} S_{min}) + S_{min} \text{ where } S_{max} \text{ and } S_{min} \text{ are user selected;}$
- (e) quantizing the transform coefficients, D_{ijmn} , to produce quantized blocks T_{ijmn} as follows:

- (i) $T_{ijmn} = round(D_{ijmn}/(S_{min}*Q_{mn}))$, where round denotes rounding to the nearest integer;
 - (ii) setting $T_{ijmn} = 0$ if $round(D_{ijmn}/(Q_{mn}*S_{ij})) = 0$;

5 and

TO LUC .

- $(iii) \ \, \text{setting} \ \, T_{ijmm} = \\ \\ sign(D_{ijmm})*(2^(ceil(lg(abs(D_{ijmm})+1))-1)-1) \ \, \text{if} \ \, abs(D_{ijmm}) \\ \\ (2^(ceil(lg(abs(D_{ijmm})+1))-1)-1) \ \, \text{is} \ \, \text{less than or equal to} \ \, \text{(abs}(D_{ijmm}-Q_{mm})^* S_{ij} * round(D_{ijmm}/(S_{ij}*Q_{mm}))));$
- (f) entropy encoding quantized coefficients $T_{_{ijmn}}$ and Q $^{*}S_{_{min}},$ to create a JPEG image file.
- 8. A method of JPEG compression of a colour image represented by channels Y for greyscale data, and U and V each for colour, comprising:
- (a) shrinking the colour channels U and V by a20 fraction of their size;
 - (a) forming a discrete cosine transform (DCT) D_{ij} for each block B_{ij} of each of channels Y, U and V;
- 25 (b) calculating a visual importance, I_{ij} , for each Y channel block of each image and setting $I_{ij} = \max\{I_{ij} \text{ values for } I_{ij}\}$

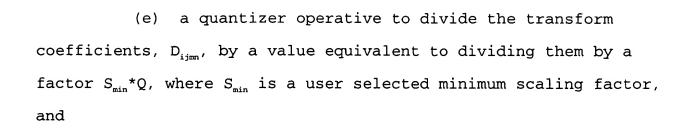

corresponding Y channel blocks} for blocks in the U and V channels;

- (c) forming a global quantization matrix Q for the Y
 5 channel block and one for channels U and V combined such that a magnitude of each quantization matrix coefficient Q_{ij} is inversely proportional to an importance in the image of a corresponding DCT basis vector; and
 - (d) quantizing the transform coefficients for each of the Y, U and V channels by dividing them by a factor S_{ij} Q', where S_{ij} is a linear scaling factor for each of channels Y, U and V and Q' is the quantization table for the associated channel being quantized; and
 - (e) entropy encoding quantized coefficients T_{ijmn} and $Q'*S_{min}$, where S_{min} is a user selected minimum scaling factor for each of channels Y, U, and V, to create a JPEG image file for each of channels Y, U and V.
 - 9. The method of claim 8 wherein the shrinking factor is 1/2.
- 10. Apparatus for JPEG compression of an image frame

 25 divided up into a plurality of non-overlapping, tiled 8 x 8 pixel blocks B_{ij} where i, j are integers covering all of the blocks in the image frame, comprising:

25

- (a) a discrete cosine transformer (DCT) operative to form the deiscrete cosine transform of each block B_{ij} of the image frame to produce a matrix of blocks of transform coefficients D_{ij} ;
- (b) a visual importance calculator operative to calculate the visual importance, I_{ij} , for each block of the image, based upon assigning zeros for flat features and values approaching unity for sharply varying features;
- (c) a global quantization matrix calculator operative to calculate the global quantization matrix, Q, by one of
 - (i) selecting a standard JPEG quantization table and
 - (ii) selecting a quantization table such that the magnitude of each quantization matrix coefficient Q_{ij} is inversely proportional to the importance in the image of the corresponding DCT basis vector; and
- (d) a linear scaling factor calculator operative to determine a linear scaling factor, S_{ij} , defining bounds over which the image is to be variably quantized based on user established values of S_{max} and S_{min} ;

- (f) an entropy encoder operative to encode the quantized coefficients $T_{\mbox{\tiny ijmn}}$ and Q $^*S_{\mbox{\tiny min}}$ to create a JPEG image file.
- 11. Apparatus according to claim 10, wherein said quantizer rounds $(D_{ijmm}/(S_{min}*Q))$ to the nearest integer to form quantized DCT transformed coefficients T_{ijmm} and
 - (a) sets $T_{ijmn} = 0$ if $round(D_{ijmn}/(Q_{mn}*S_{ij})) = 0$; and
- $(b) \quad \text{sets } T_{ijmm} = \text{sign}(D_{ijmm}) * (2^{(ceil(lg(abs(D_{ijmm})+1))-1)-1}) 1) \\ 1) \quad \text{if } abs(D_{ijmm}) (2^{(ceil(lg(abs(D_{ijmm})+1))-1)-1}) \quad \text{is less than or} \\ equal \quad \text{to } abs(D_{ijmm} Q_{mm}S_{ij} * \text{round}(D_{ijmm}/(S_{ij}*Q_{mm})));$
- 20 12. Apparatus according to claim 10, wherein said linear scaling factor calculator determines a linear scaling factor S_{ij} equal to $I_{ij}*(S_{max} S_{min}) + S_{min}$ where S_{min} and S_{max} are user specified to define bounds over which the image will be variably quantized.
